#### ALIGNMENTS

Nersus; 1742/42 is 1742/42 is noticed protein homologues of viral inhibitors of apoptosis - used to modulate apoptosis for treatment of degenerative, infectious or autoimmune diseases and cancer.

To autoimmune diseases and cancer.

To autoimmune diseases and cancer.

Claim 11; Page 71-72; 136pp; English.

MIHE (W19749) is a murine homologue of baculovirus inhibitor of apoptosis protein (IAP). Its amino acid sequence was deduced from a isolated nucleic acid (see also T72714) obtd. by a database search for sequences homologues to a baculovirus IAP repeat (BIR) consensus sequence (see also W19744). Unlike IAP, MIHE does not contain a RING finger domain. IAP homologues (see also W19745-48 and W19750-52) and their derivatives and chemical analogues can be used in methods for modulating apoptosis in animal cells, specifically for treatment, by inhibition, of degenerative and infectious disease or, by promotion, of cancer and autoimmune Gaps 16-SEP-1997 (first entry)

reating apoptosis by controlling the Survivin gene - useful for treating transplant rejection, degenerative disorders and tumours PS Disclosure; Fig 10: 108pp; English.

CC The survivin gene can be used to control apoptosis through modification of the gene. Survivin peptides can be used to inhibit cellular control apoptosis, e.g. for enhancing the viability of organs and tissues prior CC to their transplantation, for preserving the growth of cells in culture or for treating conditions involving abnormal apoptosis, e.g. degenerative diseases such as motor neuron degenerative diseases. CC such as immunosuppression, gastrointestinal perturbations, cardiovascular clisorders, apoptosis related to reperfusion damage, rejection of tissue transplantation and Alzheimer's disease. Agents which block Survivin activity can be used to treat e.g. tumours.
e.g. degenerative diseases such as motor neuron degenerative diseases, HIV infection, dermatological effects of ageing, disorders and diseases such as immunosuppression, gastrointestinal perturbations, cardiovascular disorders, apoptosis related to reperfusion damage, rejection of tissue transplantation and Alzheimer's disease. Agents which block Survivin activity can be used to treat e.g. tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           02-DEC-1998 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Modulating apoptosis by controlling the Survivin gene - useful for treating transplant rejection, degenerative disorders and tumours Claim 7: page 75: 108pp. English.

The survivin peptide is functionally relevant area of the protein. A mutation resulting in the substitutions of amino acids at sites 3; 9 and 20 with Alanine results in a complete loss of function of survivin in transfected cells. The survivin gene can be used to control apoptosis through modification of the gene. Survivin peptides can be used to inhibit capulate apoptosis, e.g. for enhancing the viability of organs and tissues prior to their transplantation, for preserving the growth of cells in culture or for treating conditions involving abnormal apoptosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      diagnosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated mycobacteria polypeptides and nucleic acids - used for developing products for the diagnosis of or vaccination against mycobacterial infections, particularly tuberculosis

Claim 1: Page 223: 163pp; English.

The present sequence represents a Mycobacterium tuberculosis protein.

Products from the present invention, which describes protein fragments and nucleic acid fragments derived from M.tuberculosis, can be used in the detection of and prevention of mycobacterial infections. In particular, the proteins and nucleic acids can be used for the diagnosis of or vaccination against tuberculosis caused by M. tuberculosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Survivin functionally relevant peptide.

Retinoblastoms suppressor protein with N-terminal modification - inhibiting cellular proliferation, particularly cancer claim 21; page 210-215; 249pp; English.

This sequence represents a modified retinoblastoms tumour suppressor protein (RTSP) of the invention. The proteins can be used for inhibiting cellular proliferation, when coadministered with a p53 protein. The RTSPs can be used for trating diseases characterised by abnormal cellular proliferation, particularly cancers. The RTSPs have a broader spectrum of activity than wild type RTSPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Retinoblastoma suppressor protein with N-terminal modification - inhibiting cellular proliferation, particularly cancer Claim 21; Page 218-222; 249pp; Page 218-222; 249pp; Page 218-222; Page 218-2222; Page 218-22222

                                                                                                                                                                            Inhibiting cellular proliferation, particularly cancer claim 21; Page 203-207; 249pp; English.

This sequence represents a modified retinoblastoma tumour suppressor protein (RTSP) of the invention. The proteins can be used for inhibiting cellular proliferation, when coadministered with a p53 protein. The RTSPs can be used for treating diseases characterised by abnormal cellular proliferation, particularly cancers. The RTSPs have a broader spectrum of sequence 797 AA;

This sequence represents a modified retinoblastoma tumour suppressor protein (RTSP) of the invention. The proteins can be used for inhibiting callular proliferation, when coadministered with a p53 protein. The RTSPs can be used for treating diseases characterised by abnormal cellular proliferation, particularly cancers. The RTSPs have a broader spectrum of activity than wild type RTSPs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     02-DEC-1998 (first entry)
Modified retinoblastoma tumour suppressor.
Modified retinoblastoma tumour suppressor; RTSP protein; cancer therapy;
edlular proliferation inhibitor.
Homo sapiens.

By chromosomal walking from the esterase D gene on chromosome 13, the retinoblastoma susceptibility gene (RB) was identified on the basis of chromosomal location, homologous deletion and tumor-specific alterations in expression. Screening of CDNA libraries yielded clone RB-5 incorporating the complete RB cDNA sequence given in Q86398 and encoding a 110-140 kDa nuclear phosphoprotein named pp110RB (R71680).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Admin. of a functional retinoblastoma polypeptide or protein used to prevent and inhibit prim. and sec. retinoblastoma-linked

                                                                                                                                          Retinoblastoma suppressor protein with N-terminal modification -
inhibiting cellular proliferation, particularly cancer
Claim 21, Page 188-192, 249pp; English.
This sequence represents a modified retinoblastoma tumour suppressor
protein (RTSP) of the invention. The proteins can be used for inhibiting
cellular proliferation, when coadministered with a p53 protein. The RTSPs
and be used for treating diseases characterised by abnormal cellular
proliferation, particularly cancers. The RTSPs have a broader spectrum of
activity than wild type RTSPs.

By Chromosomal walking from the esterase D gene on chromosome 13, the retinoblastoms susceptibility gene (RB) was identified on the basis of chromosomal location, homologous deletion and tumor-specific alterations in expression. Screening of CDNA libraries yielded clone RB-5 incorporating the complete RB cDNA sequence given in Q86398 and encoding a 110-140 kDa nuclear phosphoprotein named ppilORB (R71680). Recombinant ppilORB was prepared in E. coli, but with a P2A mutation for cloning convenience (R71681).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The sequence is that of a retinoblastoma tumour protein. The gene encoding this protein may be used in a novel method involving a recombinant adenovirus expression vector to treat diseases associated with the ansence of the TSG or the presence of a mutated 15G, e.g. many forms of carcinoma, sickle cell anaemia or Tay-Sach's

Retinoblastoma suppressor protein with N-terminal modification -
inhibiting cellular proliferation, particularly cancer
Claim 21, Page 226-230, 249pp; English.
This sequence represents a modified retinoblastoma tumour suppressor
protein (RTSP) of the invention. The proteins can be used for inhibiting
cellular proliferation, when coadministered with a p53 protein. The RTSPs
can be used for treating diseases characterised by abnormal cellular
proliferation, particularly cancers. The RTSPs have a broader spectrum of
sequence 928 AA;

Patent No. 5580955

GENERAL INFORMATION:

GENERAL INFORMATION:

APPLICANT: Nur-E-Kamal, M. S. A.; Maruta, Hiroshi

TITLE OF INVENTION: FRAGMENTS OF NEUROFIBROMIN (NF1) AND METHOD

TITLE OF INVENTION: TO REVERSE ACTIVATED RAS INDUCED MALIGNANT TRANSFORMATION

TITLE OF INVENTION: MAMMALIAN CELLS

NUMBER OF SEQUENCES:

CORRESPONDENCE ADDRESS:

ADDRESSEE: Felfe & Lynch
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TOPOLOGY: linear

Mean 21.188; Variance 27.251; scale 0.778 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

LEE K., FAJARDO M.A., BRAUN R.E.;

A testis cytoplasmic RNA-binding protein that has the properties of a translational repressor.

MOL. CELL. BIOL. 16:3023-3034(1996).

-: FUNCTION: BINDS IN VITRO TO THE PRMI 3'UTR. SEEMS TO ACT AS A GENERAL REPRESSOR OF TRANSLATION.

-: SUBCELLULAR LOCATION: NUCLEAR AND CYTOPLASMIC.

HUM. MUTAT. 12:434-434(1998).

-!- FUNCTION: PROBABLY ACTS AS A REGULATOR OF OTHER GENES. FORMS A COMPLEX WITH ADENOVIRUS EIA AND WITH SY40 LARGET ANTICEN. ACTS AS A TUMOR SUPPRESSOR. MAY BIND AND MODULATE FUNCTIONALLY CERTAIN CELLULAR PROTEINS WITH WHICH T AND EIA COMPETE FOR POCKET BINDING. POTENT INHIBITOR OF E2F-MEDIATED TRANS-ACTIVATION, INTERACTS
PREFERRITALLY WITH TRANSCRIPTION FACTOR E2F1.
                                                                                                                                                                                                                                                                                                                                                                                         MEDLINE; 93348271.

CHILDHOOD CANCER RETINOBLASTOMA (RB). RB IS A CONGENITAL
MALIGNANT TUMOR THAT ARISES FROM THE NUCLERA LAFERS OF THE
RETINA. IT OCCURS IN ABOUT 1:20.000 LIVE BIRTHS AND REPRESENTS
ABOUT 2% OF CHILDHOOD MALIGNANCIES. IT IS BILATERAL IN ABOUT 30%
OF CASES. ALTHOUGH MOST RB APPEAR SPORADICALLY, ABOUT 20% ARE
PENNEMITED AS AN AUTOSOMAL DOMINANT TRAIT WITH INCOMPLETE
PENNEMICE. THE DIAGMOSIS IS USUALLY MADE BEFORE THE AGE OF 2
YEARS WHEN STRABISMUS OR A GREY TO YELLOW REFLEX FROM PUPIL ("CAT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
